qrng	<i>Compute Quasi-Random Sequences</i>
------	---------------------------------------

Description

Computing Korobov, generalize Halton and Sobol’ quasi-random sequences.

Usage

```
korobov(n, d = 1, generator, randomize = c("none", "shift"))
ghalton(n, d = 1, method = c("generalized", "halton"))
sobol (n, d = 1, randomize = c("none", "digital.shift", "Owen", "Faure.Tezuka",
                                "Owen.Faure.Tezuka"), seed, skip = 0, ...)
```

Arguments

n	number n of points to be generated ≥ 2 .
d	dimension d .
generator	numeric of length d or length 1 (in which case it is appropriately extended to length d). All numbers must be in $\{1, \dots, n\}$ and must be (coercible to) integers.
randomize	character string indicating the type of randomization for the point set. korobov() one of the following: "none" no randomization. "shift" a uniform random variate modulo 1. sobol() one of the following: "none" no randomization. "digital.shift" a digital shift. "Owen" calls <code>generate_sobol_owen_set()</code> from package spacefillr . "Faure.Tezuka","Owen.Faure.Tezuka" calls <code>sobol()</code> from package randtoolbox with scrambling being 2 and 3, respectively. If randomize is a logical , then it is interpreted as "none" if FALSE and "digital.shift" if TRUE.
method	character string indicating which sequence is generated, generalized Halton or (plain) Halton.
seed	if provided, an integer used within <code>set.seed()</code> for the non-scrambling randomize methods (so "none" or "digital.shift") or passed to the underlying <code>generate_sobol_owen_set()</code> from package spacefillr (for "Owen") and <code>sobol()</code> from package randtoolbox for the scrambling methods. If not provided, the non-scrambling methods respect a global <code>set.seed()</code> but the scrambling methods do not (they then use a randomly generated one based on time and process identifier).
skip	number of initial points in the sequence to be skipped (<code>skip = 0</code> means the sequence starts with at the origin). Note that for the scrambling methods this simply computes $n + \text{skip}$ points and omits the first skip-many.
...	additional arguments passed to <code>sobol()</code> from package randtoolbox for randomization methods "Faure.Tezuka" and "Owen.Faure.Tezuka".

Details

For `sobol()` examples see `demo(sobol_examples)`.

Note that these procedures call fast C code. The following restrictions apply:

korobov() n, d must be $\leq 2^{31} - 1$.

ghalton() n must be $\leq 2^{32} - 1$ and d must be ≤ 360 .

sobol() if `randomize = "none"` or `randomize = "digital.shift"`, n must be $\leq 2^{31} - 1$ and d must be ≤ 16510 .

The choice of parameters for `korobov()` is crucial for the quality of this quasi-random sequence (only basic sanity checks are conducted). For more details, see l'Ecuyer and Lemieux (2000).

The generalized Halton sequence uses the scrambling factors of Faure and Lemieux (2009).

Value

`korobov()` and `ghalton()` return an (n, d) -matrix; for $d = 1$ an n -vector is returned.

Lemieux, C., Cieslak, M., Luttmer, K. (2004). RandQMC User's guide. See <https://www.math.uwaterloo.ca/~clemieux/randqmc/>

Examples

```
n <- 1021 # prime
d <- 4 # dimension

## Korobov's sequence
generator <- 76 # see l'Ecuyer and Lemieux
u <- korobov(n, d = d, generator = generator)
pairs(u, gap = 0, pch = ".", labels = as.expression(
  sapply(1:d, function(j) bquote(italic(u[.(j)]))))))

## Randomized Korobov's sequence
set.seed(271)
u <- korobov(n, d = d, generator = generator, randomize = "shift")
pairs(u, gap = 0, pch = ".", labels = as.expression(
  sapply(1:d, function(j) bquote(italic(u[.(j)]))))))

## Generalized Halton sequence (randomized by definition)
set.seed(271)
u <- ghalton(n, d)
pairs(u, gap = 0, pch = ".", labels = as.expression(
  sapply(1:d, function(j) bquote(italic(u[.(j)]))))))

## For sobol() examples, see demo(sobol_examples)
```

test_functions

*Test Functions***Description**

Functions for testing low-discrepancy sequences.

Usage

```
sum_of_squares(u)
sobol_g(u, copula = copula::indepCopula(dim = ncol(u)), alpha = 1:ncol(u), ...)
exceedance(x, q, p = 0.99, method = c("indicator", "individual.given.sum.exceeds",
                                     "sum.given.sum.exceeds"))
```

Arguments

u	(n, d)-matrix containing n d -dimensional realizations (of a potential quasi-random number generator). For <code>sum_of_squares()</code> these need to be marginally standard uniform and for <code>sobol_g()</code> they need to follow the copula specified by <code>copula</code> .
copula	Copula object for which the inverse Rosenblatt transformation exists.
alpha	vector of parameters of Sobol's g test function.
...	additional arguments passed to the underlying <code>cCopula()</code> .
x	(n, d)-matrix containing n d -dimensional realizations.
q	"indicator" d -vector containing the componentwise thresholds; if a number it is recycled to a d -vector. "individual.given.sum.exceeds" , "sum.given.sum.exceeds" threshold for the sum (row sums of x).
p	If q is not provided, the probability p is used to determine q . "indicator" d -vector containing the probabilities determining componentwise thresholds via empirical quantiles; if a number, it is recycled to a d -vector. "individual.given.sum.exceeds" , "sum.given.sum.exceeds" probability determining the threshold for the sum (row sums of x) via the corresponding empirical quantile.
method	character string indicating the type of exceedance computed (see Section Value below).

Details

For examples see the demo `man_test_functions`.

See `ES_np(<matrix>)` from **qrmtools** for another test function.

Value

`sum_of_squares()` returns an n -vector (`numeric(n)`) with the rowwise computed scaled sum of squares (theoretically integrating to 1).

`sobol_g()` returns an n -vector (`numeric(n)`) with the rowwise computed Sobol' g functions.

`exceedance()`'s return value depends on method:

"indicator" returns indicators whether, componentwise, x exceeds the threshold determined by q .

"individual.given.sum.exceeds" returns all rows of x whose sum exceeds the threshold determined by q .

"sum.given.sum.exceeds" returns the row sums of those rows of x whose sum exceeds the threshold determined by q .

Examples

```
## Generate some (here: copula, pseudo-random) data
library(copula)
set.seed(271)
cop <- claytonCopula(iTau(claytonCopula(), tau = 0.5)) # Clayton copula
U <- rCopula(1000, copula = cop)

## Compute sum of squares test function
mean(sum_of_squares(U)) # estimate of  $E(3(\sum_{j=1}^d U_j^2)/d)$ 

## Compute the Sobol' g test function
if(packageVersion("copula") >= "0.999-20")
  mean(sobol_g(U)) # estimate of  $E(<\text{Sobol's g function}>)$ 

## Compute an exceedance probability
X <- qnorm(U)
mean(exceedance(X, q = qnorm(0.99))) # fixed threshold q
mean(exceedance(X, p = 0.99)) # empirically estimated marginal p-quantiles as thresholds
```

```
## Compute 99% expected shortfall for the sum
mean(exceedance(X, p = 0.99, method = "sum.given.sum.exceeds"))
## Or use ES_np(X, level = 0.99) from 'qrmtools'
```

to_array

Compute Matrices to Arrays

Description

Converting higher-dimensional matrices of quasi-random numbers to arrays of specific formats.

Usage

```
to_array(x, f, format = c("(n*f,d)", "(n,f,d)"))
```

Arguments

x (n,fd) -matrix of quasi-random numbers to be converted.
f factor $f \geq 1$ dividing $\text{ncol}\{x\}$.
format **character** string indicating the output format to which x should be converted.

Details

to_array() is helpful for converting quasi-random numbers to time series paths.

Value

$(n * f, d)$ -**matrix** or (n, f, d) -**array** depending on the chosen format.

[korobov\(\)](#), [ghalton\(\)](#), [sobol\(\)](#).

Examples

```
## Basic call
N <- 4 # replications
n <- 3 # time steps
d <- 2 # dimension
set.seed(271) # note: respected for the choice of 'randomize'
x <- sobol(N, d = n * d, randomize = "digital.shift") # higher-dim. Sobol'
stopifnot(dim(to_array(x, f = n)) == c(N * n, d)) # conversion and check
stopifnot(dim(to_array(x, f = n, format = "(n,f,d)")) == c(N, n, d))

## See how the conversion is done
```

```
(x <- matrix(1:(N * n * d), nrow = N, byrow = TRUE))  
to_array(x, f = n) # => (n * d)-column x was blocked in n groups of size d each
```
