Abstract

“Applied Econometrics with R” (Kleiber and Zeileis 2008, Springer-Verlag, ISBN 978-0-387-77316-2, pp. vii+222) is the first book on applied econometrics using the R system for statistical computing and graphics (R Development Core Team 2008). It presents hands-on examples for a wide range of econometric models, from classical linear regression models for cross-section, time series or panel data and the common non-linear models of microeconometrics, such as logit, probit, tobit models as well as regression models for count data, to recent semiparametric extensions. In addition, it provides a chapter on programming, including simulations, optimization and an introduction to R tools enabling reproducible econometric research. The methods are presented by illustrating, among other things, the fitting of wage equations, growth regressions, dynamic regressions and time series models as well as various models of microeconometrics.

The book is accompanied by the R package **AER** (Kleiber and Zeileis 2009) which contains some new R functionality, some 100 data sets taken from a wide variety of sources, the full source code for all examples used in the book, as well as further worked examples, e.g., from popular textbooks.

This vignette provides an overview of the package contents and contains a list of errata for the book.

Keywords: econometrics, statistical software, R.

1. Package overview

1.1. R code from the book

The full R code from the book is provided in the demos for the package **AER**. The source scripts can be found in the `demo` directory of the package and executed interactively by calling `demo()`, as in

```
R> demo("Ch-Intro", package = "AER")
```

One demo per chapter is provided:

- `Ch-Intro` (Chapter 1: Introduction),
- `Ch-Basics` (Chapter 2: Basics),

- `Ch-LinearRegression` (Chapter 3: Linear Regression),
- `Ch-Validation` (Chapter 4: Diagnostics and Alternative Methods of Regression),
- `Ch-Microeconometrics` (Chapter 5: Models of Microeconometrics),
- `Ch-TimeSeries` (Chapter 6: Time Series),
- `Ch-Programming` (Chapter 7: Programming Your Own Analysis).

This list of demos is also shown by `demo(package = "AER")`.

The same scripts are contained in the `tests` directory of the package so that they are automatically checked and compared with the desired output provided in `.Rout.save` files.

To make the code fully reproducible and to avoid some lengthy computations in the daily checks, a few selected code chunks are commented out in the scripts. Also, for technical reasons, some graphics code chunks are repeated, once commented out and once without comments.

1.2. Data sets

The **AER** package includes some 100 data sets from leading applied econometrics journals and popular econometrics textbooks. Many data sets have been obtained from the data archives of the *Journal of Applied Econometrics* and the *Journal of Business & Economic Statistics*. Some of these are used in recent textbooks, among them Baltagi (2002), Davidson and MacKinnon (2004), Greene (2003), Stock and Watson (2007), and Verbeek (2004). In addition, we provide all further data sets from Baltagi (2002), Franses (1998), Greene (2003), and Stock and Watson (2007).

Detailed information about the source of each data set, descriptions of the variables included, and usually also examples for typical analyses are provided on the respective manual pages. A full list of all data sets in **AER** can be obtained via

```
R> data(package = "AER")
```

In addition, manual pages corresponding to selected textbooks are available. They list all data sets from the respective book and provide extensive code for replicating many of the empirical examples. See, for example,

```
R> help("Greene2003", package = "AER")
```

for data sets and code for Greene (2003). Currently available manual pages are:

- `Baltagi2002` for Baltagi (2002),
- `CameronTrivedi1998` for Cameron and Trivedi (1998),
- `Franses1998` for Franses (1998),
- `Greene2003` for Greene (2003),
- `StockWatson2007` for Stock and Watson (2007).

1.3. New R functions

AER provides a few new R functions extending or complementing methods previously available in R:

- `tobit()` is a convenience interface to `survreg()` from package **survival** for fitting tobit regressions to censored data. In addition to the fitting function itself, the usual set of accessor and extractor functions is provided, e.g., `print()`, `summary()`, `logLik()`, etc. For more details see `?tobit`.
- `ivreg()` fits instrumental-variable regressions via two-stage least squares. It provides a formula interface and calls the workhorse function `ivreg.fit()` which in turn calls `lm.fit()` twice. In addition to the fitting functions, the usual set of accessor and extractor functions is provided, e.g., `print()`, `summary()`, `anova()`, etc. For more details see `?ivreg`, `?ivreg.fit`, and `?summary.ivreg`, respectively.
- `dispersiontest()` tests the null hypothesis of equidispersion in Poisson regressions against the alternative of overdispersion and/or underdispersion. For more details see `?dispersiontest`.

2. Errata

The following errors have been found in the book so far.

Please report any further errors you find to us.

- p. 85–86: Due to a bug in the `summary()` method for “**plm**” objects, the degrees of freedom reported for the F statistics were interchanged and thus the p values were not correct. Therefore, the p values printed in the book at the end of `summary(gr_fe)` and `summary(gr_re)` are not correct, they should both be $< 2.22\text{e-}16$. Using **plm** 1.1-1 or higher, the code produces the correct output.
- p. 92: Exercise 6 cannot be solved using PSID1982 since that data set only contains a cross-section while Hausman-Taylor requires panel data. A panel version has been available in the **plm** package under the name `Wages`; we have now added PSID7682 to **AER** for completeness (and consistent naming conventions). Use PSID7682 for the exercise.
- p. 169: The comment regarding the output from the Johansen test is in error. The null hypothesis of no cointegration is not rejected at the 10% level. Nonetheless, the table corresponding to Case 2 in Juselius (2006, p. 420) reveals that the trace statistic is significant at the 15% level, thus the Johansen test weakly confirms the initial two-step approach.
- p. 179: For consistency, the GARCH code should be preceded by `data("MarkPound")`.
- p. 205: The reference for Henningsen (2008) should be:
